POLICY:

As per JCAHO Standard R1.2.160, patients have the right to pain management. In order to meet this standard, the emergency department staff will assess patients for pain and educate all relevant providers about pain assessment and management.

Components of the pain assessment will include use of a 10 point pain scale, or "Grimace Face" pain scale in pediatrics, as part of the initial evaluation, periodically during the patient's stay in the ED, and at discharge.

Management of pain will include, but not be limited to, tailoring oral, intramuscular, subcutaneous, and intravenous analgesics to the patient. The pain management strategy will take into consideration the patient's allergies, co-morbidities, and medication profile.

Management will also include appropriate monitoring of the patient after receiving analgesics to assess for response, sensitivities, and toxicities.

IMPLEMENTATION:

- All nurses and physicians working in the emergency department will be periodically in serviced on pain assessment and management
- Patients will be assessed using a Numerical Rating Scale (NRS): 0 (no pain) - 10 (worst pain imaginable) or Grimace Face Scale in Pediatrics
- Pain related history and physical findings will be elicited by the care team and will include components such as those presented in Appendix 1. The primary nurse for a patient with significant pain will inform an ED physician immediately to begin management,
- Analgesia will be tailored for the patient's pain, see Appendix 2 and 3
  - The recommended initial dose of intravenous morphine in adults is 4 mg (0.05-0.1 mg/kg/dose in pediatrics); up to 10 mg can be given in patients who have chronic pain
  - The recommended initial dose of intravenous hydromorphone is 0.5 mg (0.015mg/kg/dose in pediatrics) up to 1.4 mg in patients who have chronic pain
- Patients receiving greater than an initial dose of 10 mg of morphine or 1.4 mg of hydromorphone should have a "clinical decision" note entered on the chart and consideration given to contacting the pain service.
- Repeat dosing of morphine or hydromorphone should not be more frequent than every 30 minutes; when given more frequently a "clinical decision" note should be entered on the chart.
- Patients requiring more than three doses of intravenous pain medications in a 3 hour period should be considered for a Pain Service consult.
  - Patients receiving intravenous opioids and sedative/hypnotics concomitantly will be placed on continuous pulse oximetry and the sedation/analgesia policy will be activated.
  - Patients receiving intravenous opioids will be reassessed periodically:
    - A NRS score will be assessed and charted within 30 minutes after each IV dose.
    - Excessive sedation or desaturation on pulse oximetry below 94% will be a consideration for additional monitoring.
    - The patient may not be discharged home or be transported to an inappropriately monitored setting, unless reassessed for the following:
      - Level of sedation: arousable to gentle physical stimulation
      - Respiratory rate: < 10 per minute or age appropriate in pediatrics
      - Oxygen saturation: persistently < 94% on room air oxygen when the initial saturation was > 96%
Appendix 1: History and Physical Evaluation of Patients with Pain

History
- History of present illness (HPI)
  - Onset
  - Duration
  - Quality, character
  - Ameliorating and provoking factors
  - Patient rating if possible
- Current medications
- Medication allergies
- Past medical history
  - Any past history of similar pain?
    - What treatment has helped in the past
    - What studies have been done
  - Assess factors that would affect medication use
    - liver disease
    - renal disease
    - Sleep apnea or COPD
    - Morbid obesity
    - peptic ulcer disease
- Psychological assessment
- Social history
- Allergies

Physical Exam
- Vital signs: before and after pain medications
- Pain score: before and after treatment
- Pain as the abnormal 5th vital sign will include a numerical score greater than 5, and may be accompanied by:
  (a) Increased respiratory rate and effort,
  (b) Body rigidity or thrashing
  (c) Facial grimacing,
  (d) Pacing
In pediatrics, a score greater than 5 may be accompanied by:
  (a) Crying, grunting, breath holding,
  (b) Facial grimacing,
  (c) Clinging to the caregiver or family member,
  (d) Lack of movement, or
  (e) Irritability, restlessness, aggression.
- Focused physical exam: system specific depending on complaint
- Functional assessment
## Appendix 2: Non-narcotic analgesics in the Emergency Department
